

The MCS Group & Blackout, a faster, easier way to protect PII

The MCS Group understands the importance of protecting PII and privileged information, but also knows that with more ESI to review and more data regulations, the cost and turnaround time for redaction can be a huge burden. That's why MCS offers Blackout.

Redaction Made Simple

Manual redaction is tedious, costly, and slow. Blackout identifies and automatically redacts words, phrases, and patterns - such as SSNs, emails, etc. - that you specify. Blackout also lets you configure the type of redaction (text or black box, for example) and the scope (just the word, the full page, etc.).

Protect PII & Privileged Info

The risks around disclosing PII or privileged information during discovery are higher than ever, so there's no room for error. Blackout significantly reduces the cost and turnaround time of review, but just as importantly, it reduces the risk of human error leading to accidental disclosure.

More Accurate Review

By automating the redaction process, Blackout frees up reviewers' time for ensuring the most accurate review. Reviewers can accept, reject, or manually override Blackout's markups right within the Relativity viewer, without interrupting their workflow.
